Syntax
Component Story Format (CSF)

The key ingredients are the default export that describes the component, and named exports that describe the stories.

- The default export metadata controls how Storybook lists your stories and provides information used by addons

- Using named exports (such as Default) is how you define your component's stories. These show up underneath the Story and represent different states of the component

- To promote re-use, it's standard practice to create a "template"

Args, Parameters, and Decorators

Allow you to tweak your Stories and Storybook at either the individual story level or Component level (all stories)

- **Args**: The "props" defined for your Story

- **Parameters**: Metadata about a story, typically used to control the behavior of Storybook features and addons

- **Decorators**: A way to wrap a story in extra "rendering" functionality. Typically used to wrap stories with extra markup or context mocking
